Background:
**Trends in DK, Why H.C.
Andersens Boulevard,
Former studies**

Methods:
Design / overview = HOW?

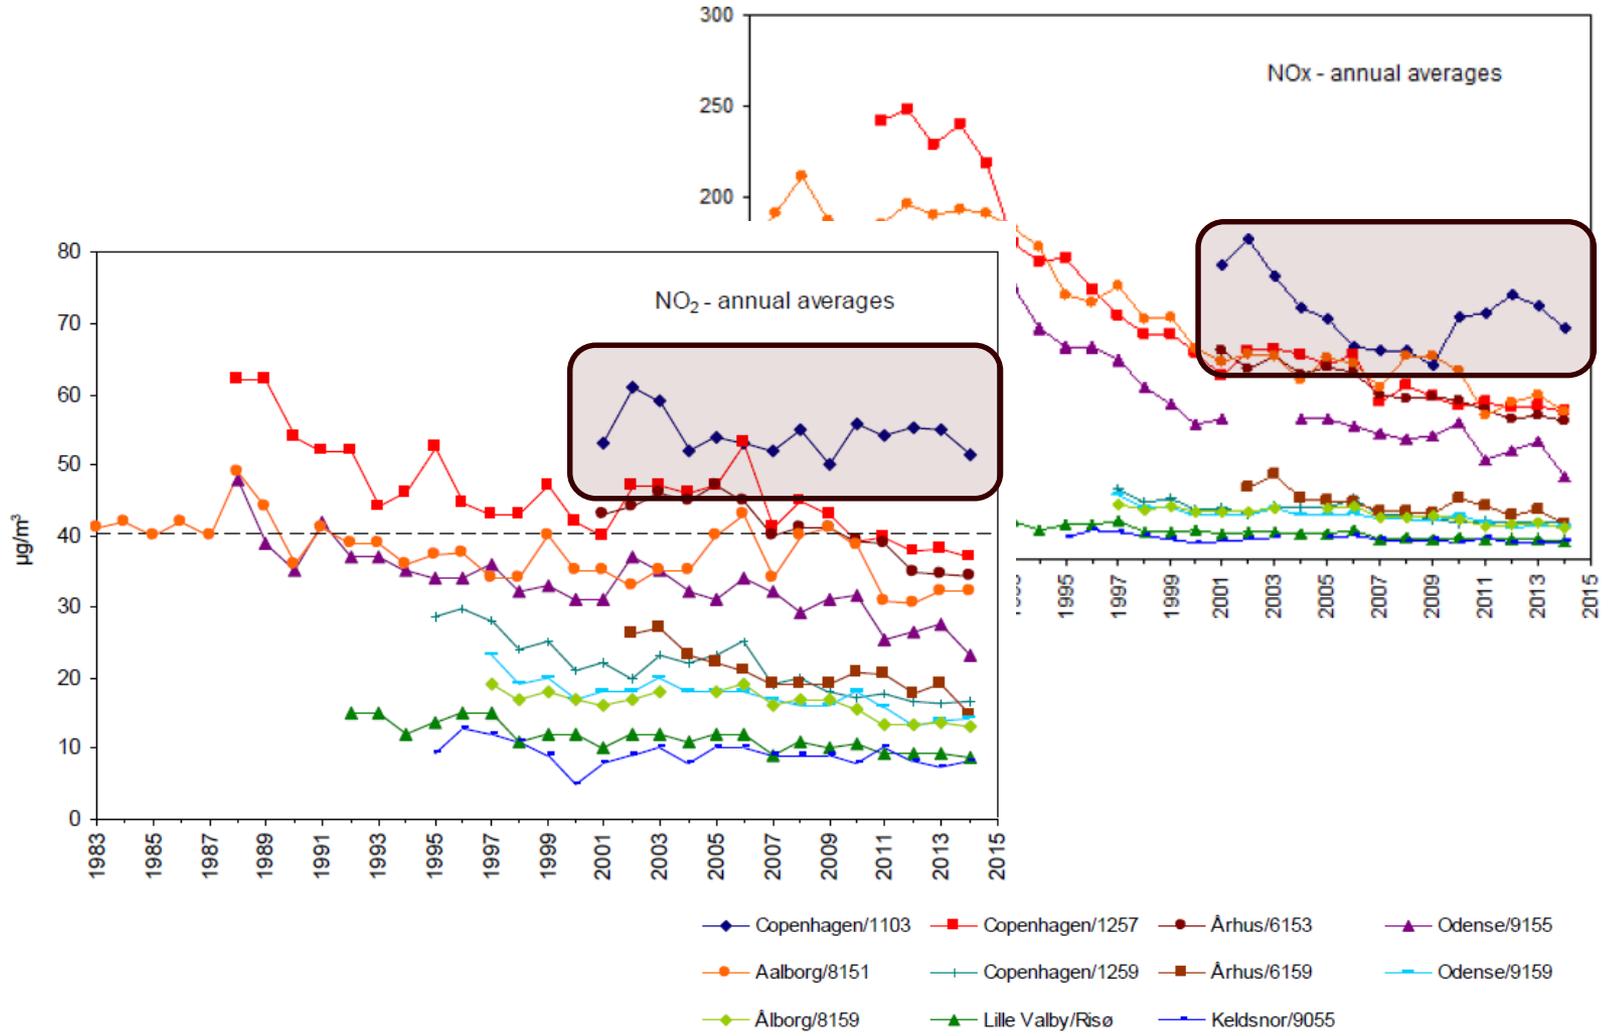

Results:
**Traffic counts /emission
modelling, OSPM modelling
Passive sampling**

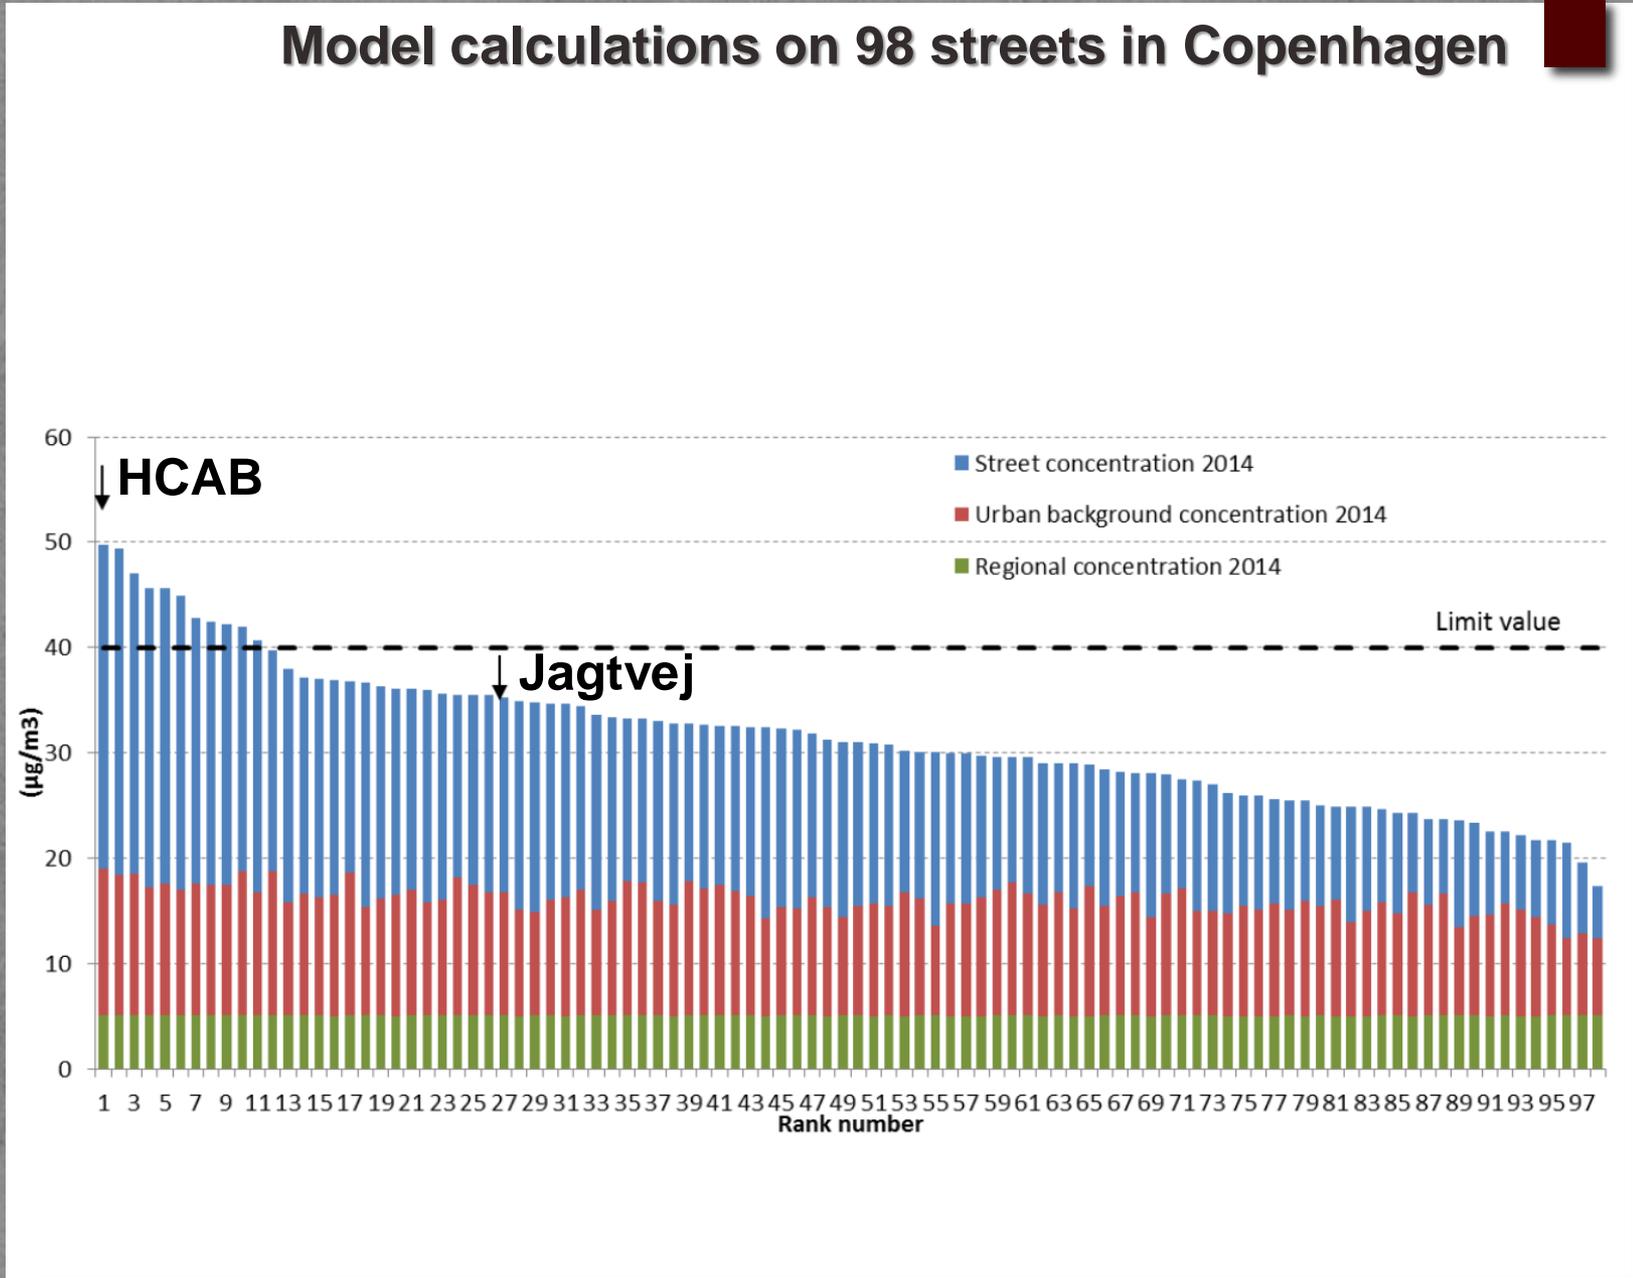

Conclusions:
Resume the main points and
the **future** directions

NO₂ / NOx trends in Denmark

- Why H.C. Andersens Boulevard (= HCAB) ?

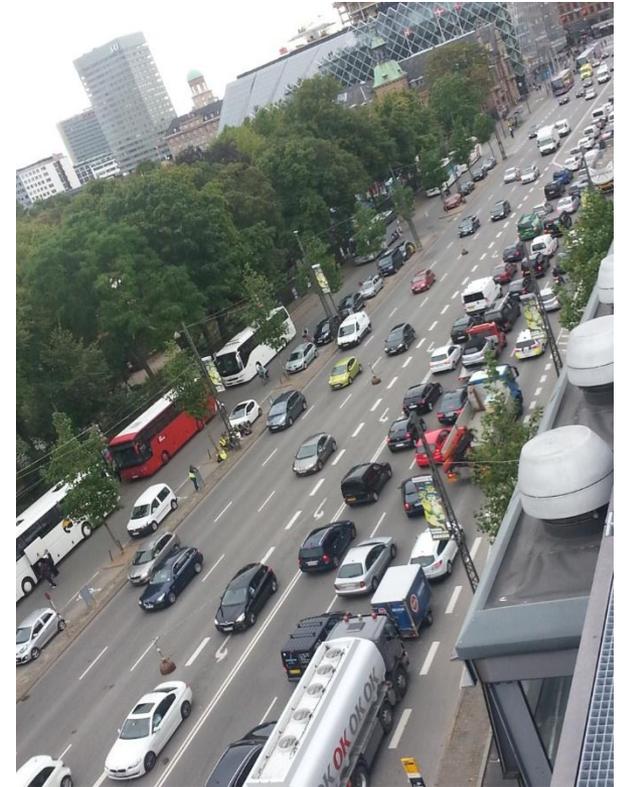

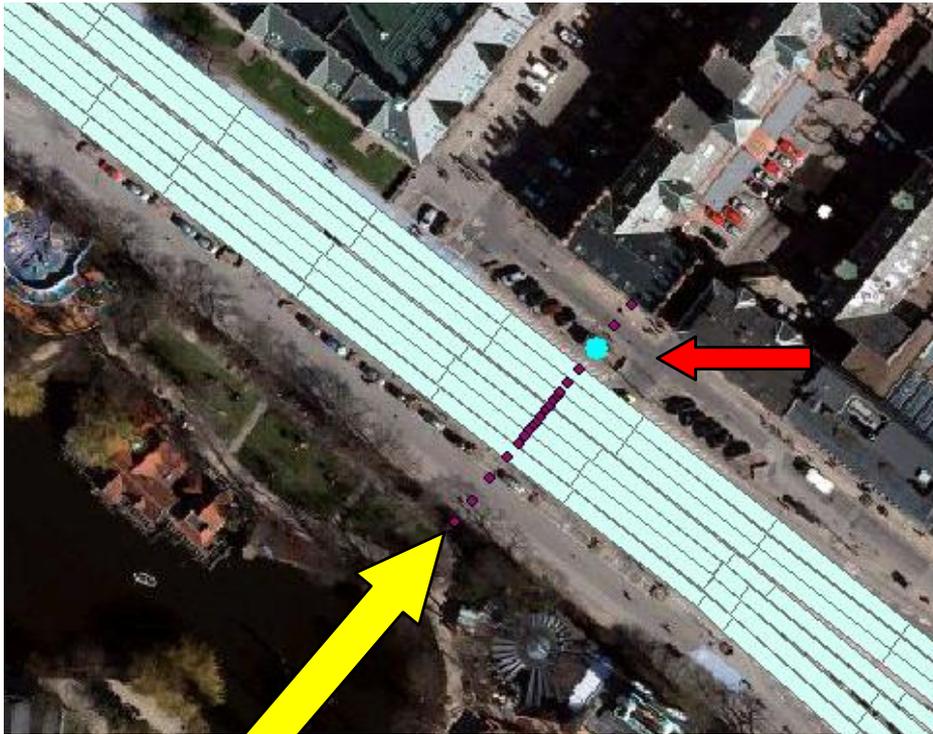

Model calculations on 98 streets in Copenhagen

H.C. Andersens Boulevard

- ❑ 52 000 veh / day
- ❑ Travel speed 16... 44 km/h

**H17-163: Investigation of Traffic Pollution
Near DK's NO₂ HOT-SPOT**

Compare two street stations:

"jump" NO_x +30..35 µg/m³
 NO₂ + 8..10 µg/m³

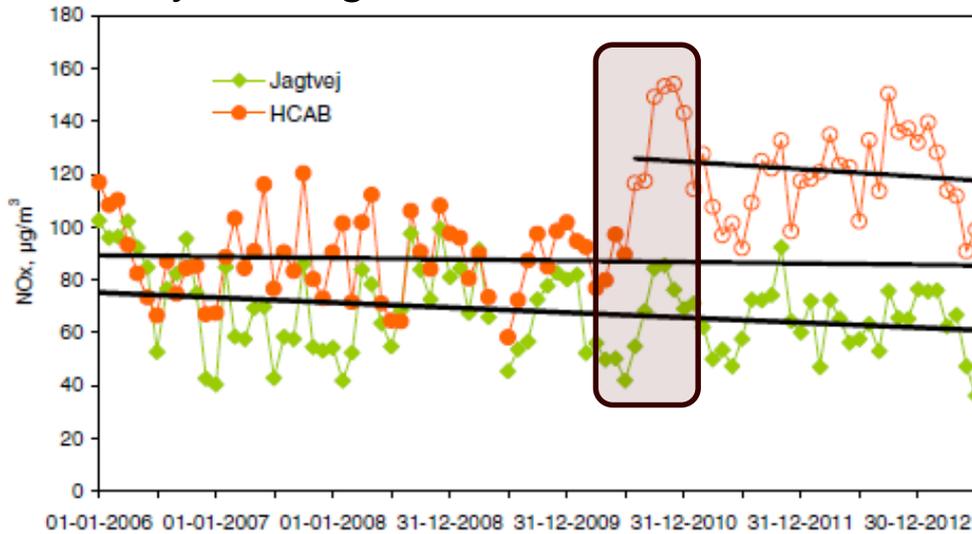

Annual averages

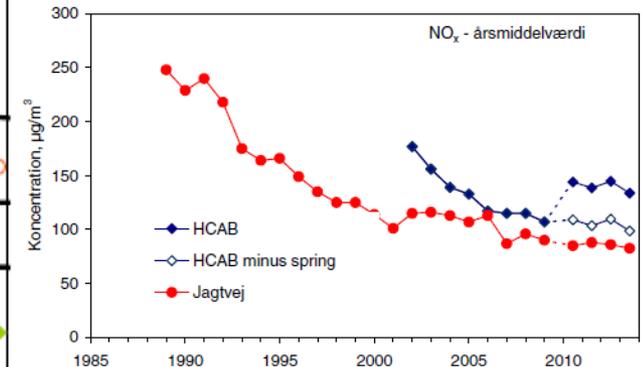

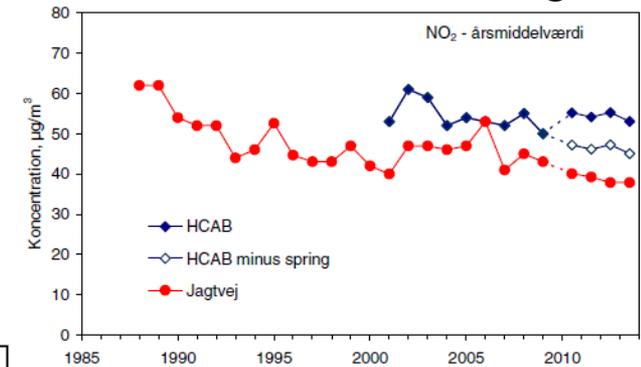

Compare two street stations:
Jagtvej vs. HCAB

"jump" NO_x 30..35 µg/m³
NO₂ 8..10 µg/m³

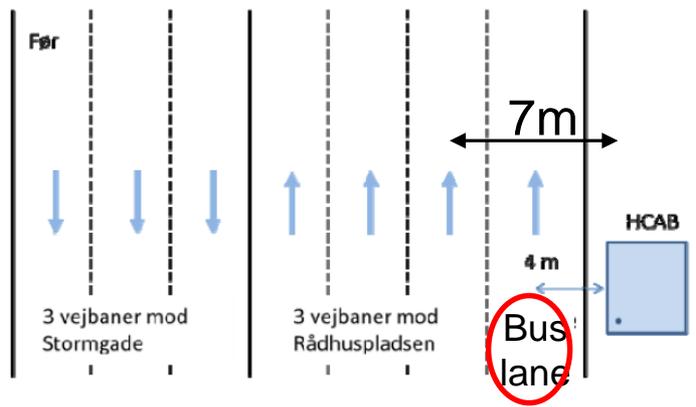

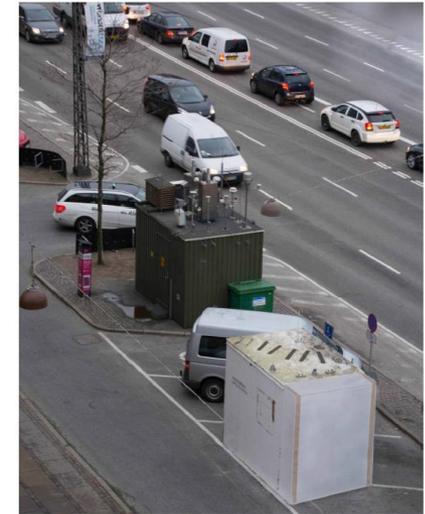

Monthly averages

Annual averages

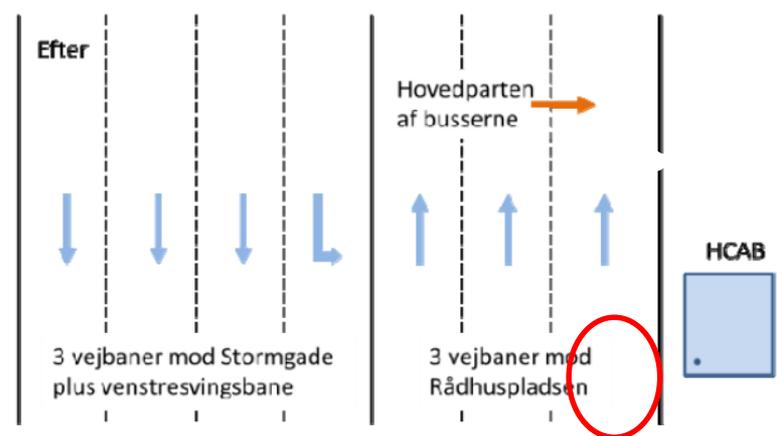

- ❑ Feb.-June 2014
- ❑ re-establish the 'old' distance to traffic lanes

Before summer 2010

After summer 2010

H17-163: Investigation of Traffic Pollution Near DK's NO₂ HOT-SPOT

Parallel station 2014

Mean concentrations
period: 8/2 – 23/6 2014

		NO ₂	NO _x
HCAB	µg/m ³	55	129
HCAB-ekstra	µg/m ³	45	100
Forskøl	µg/m ³	10	29
Relativ forskøl	%	18	23

background

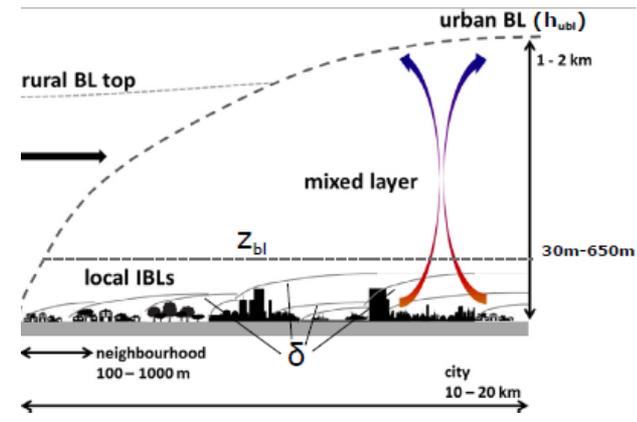

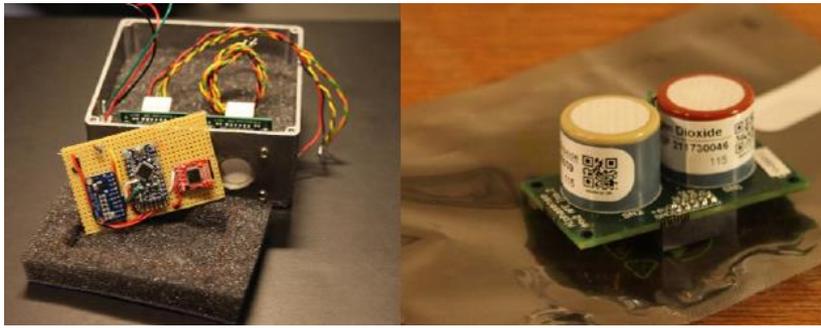

- ❑ Reanalysing 2014 parallel measurements
- ❑ Detailed traffic counts 2015 and emission modelling
- ❑ Modelling with OSPM
- ❑ Passive sampling using "Radiello" samplers
- ❑ *Sonic measurements in street and roof top* (T.-B- Ottosen H17-140)

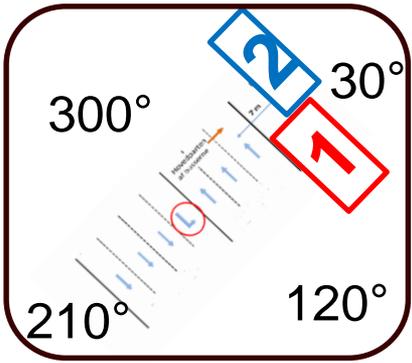

- ❑ *Low cost sampler testing*
Alpha sense type
Master thesis, Feb. 2016

Parameterised model

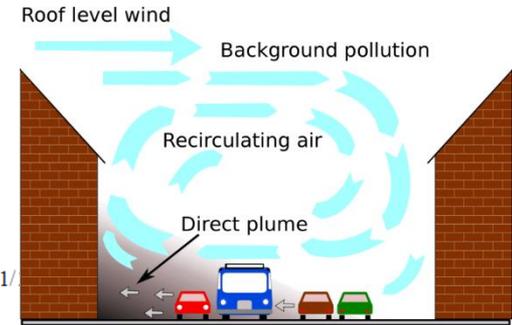

Based on physics

- Direct plume
- Traffic produced turbulence

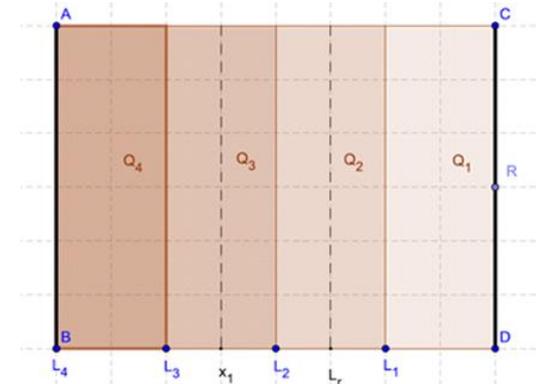

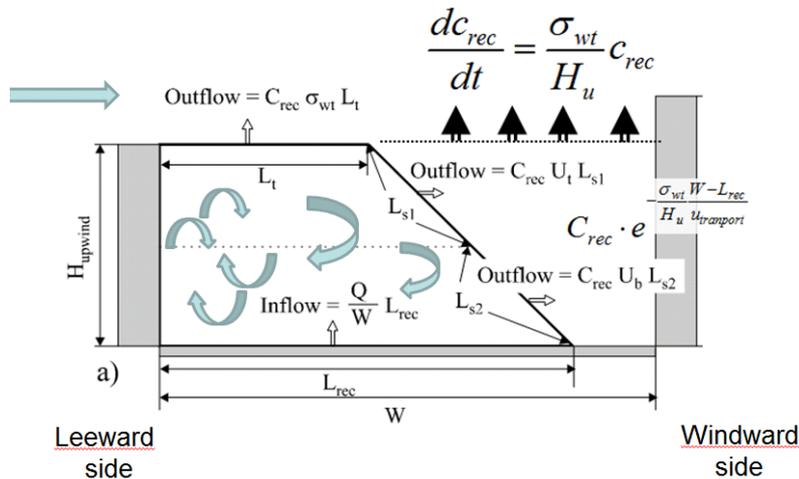

$$\sigma_z(x) = \sigma_w \frac{x}{u_b} + h_o$$

$$\sigma_w = \left((\alpha u_b)^2 + \sigma_{wo}^2 \right)^{1/2}$$

$$\sigma_{wo}^2 = b^2 V^2 D$$

- Recirculation

Standard OSPM fits well with "extra" station 2

OSPM_NOx HCAB1_NOx HCAB2_NOx

background

Methods

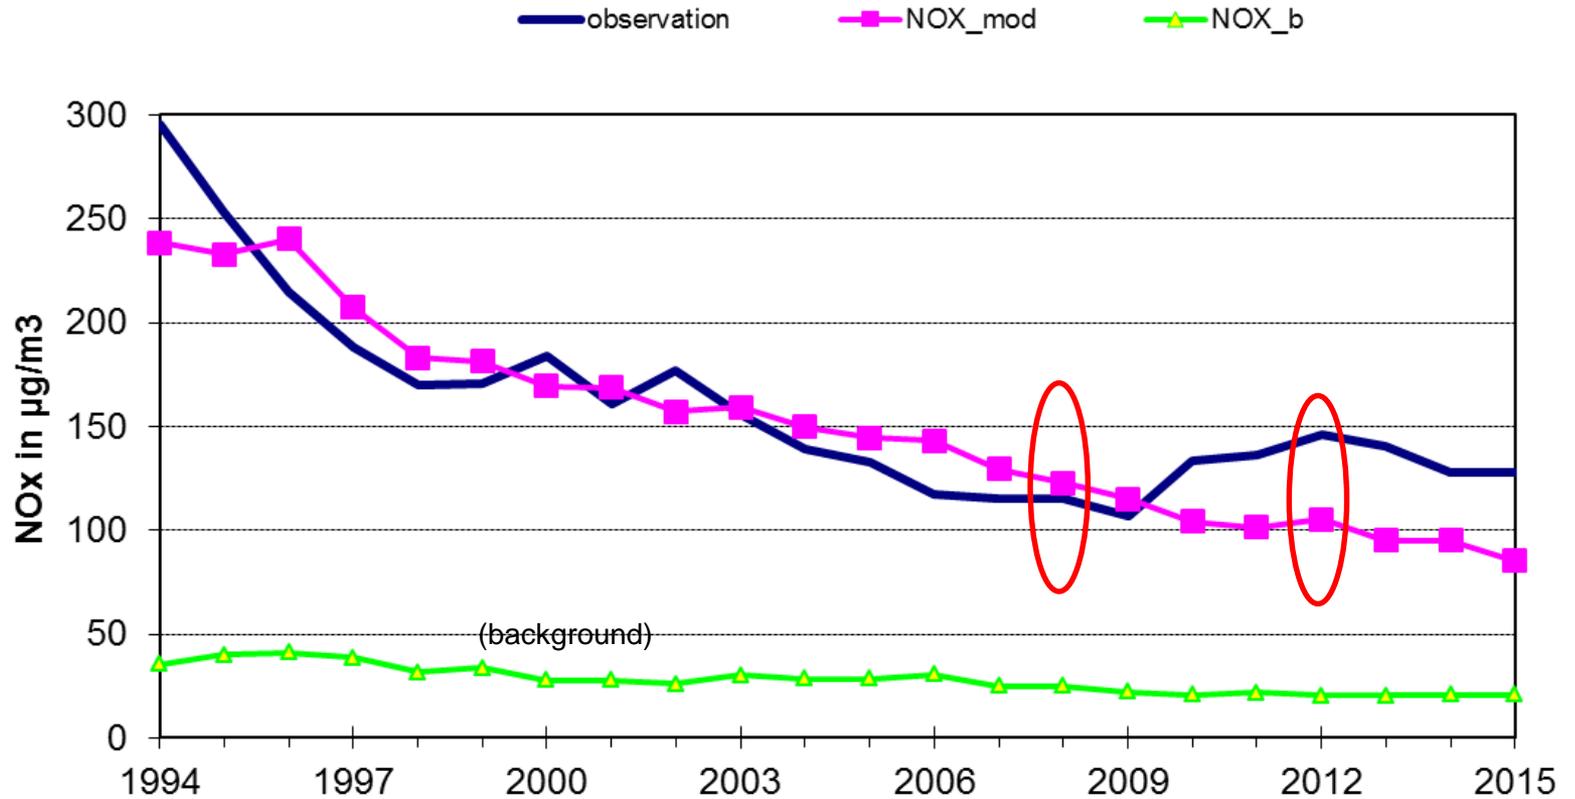

Results

In Progress

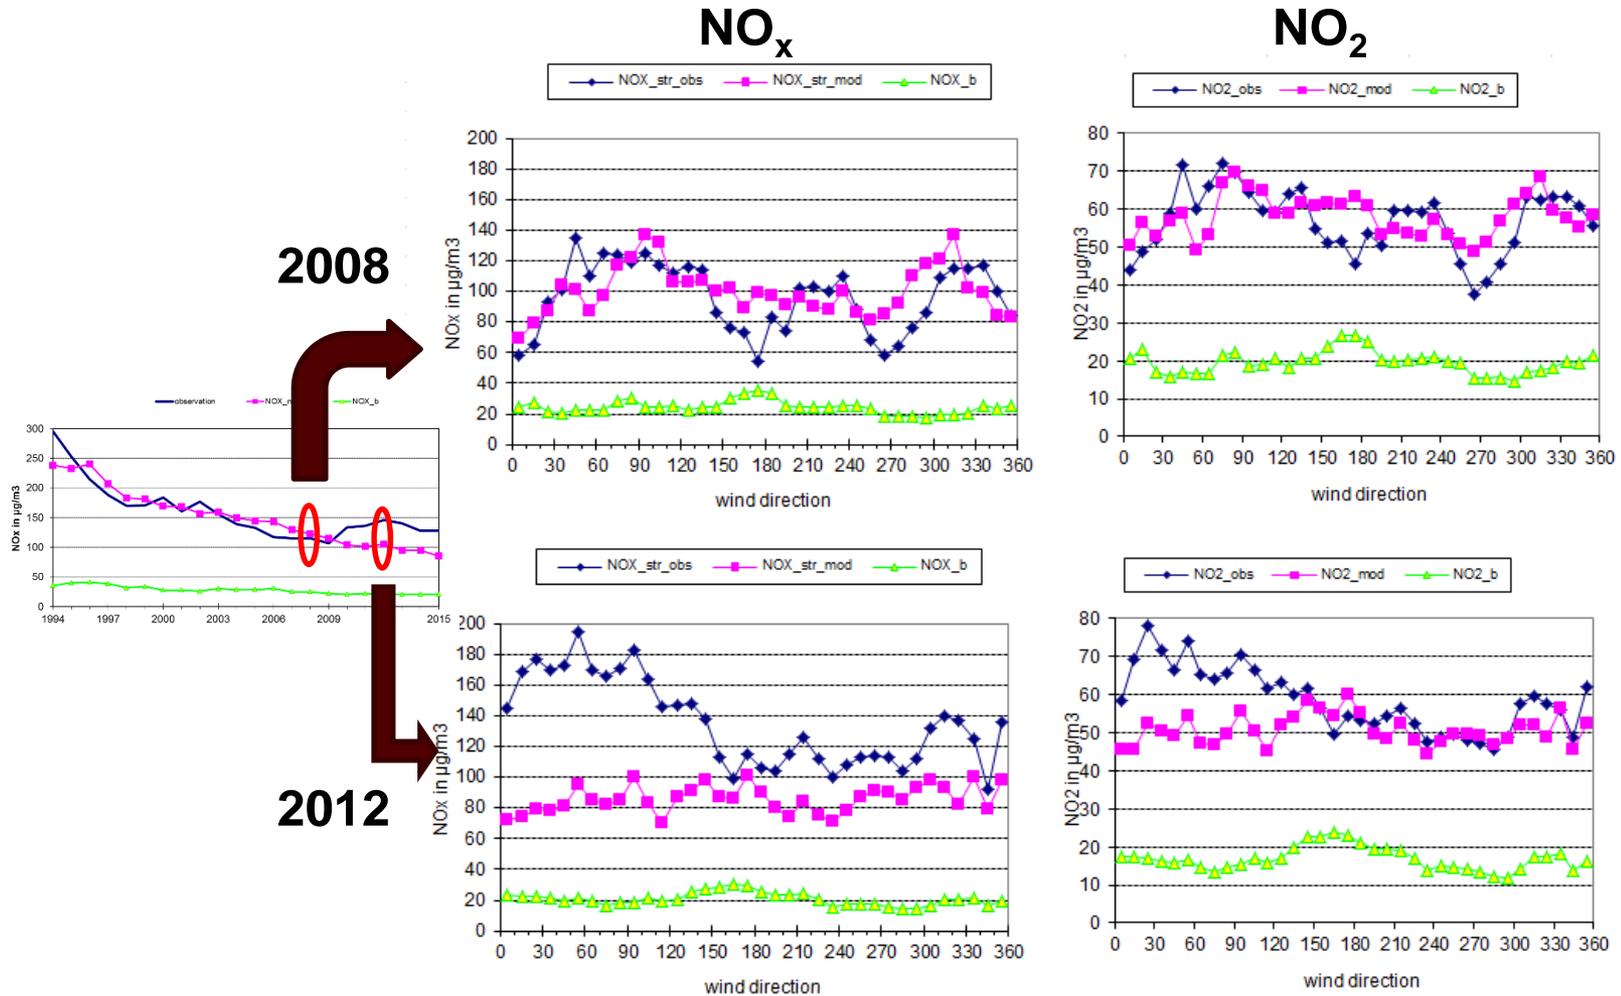

Modelling long term trends

- NOx annual mean at HCAB station
- "Standard" OSPM

Wind direction dependence

background

Methods

Results

In Progress

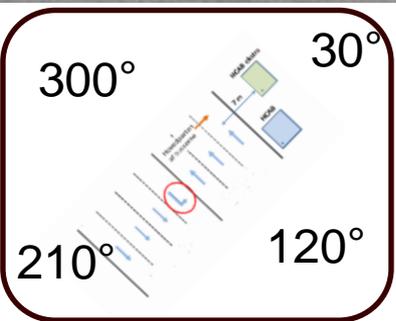

background

Methods

Results

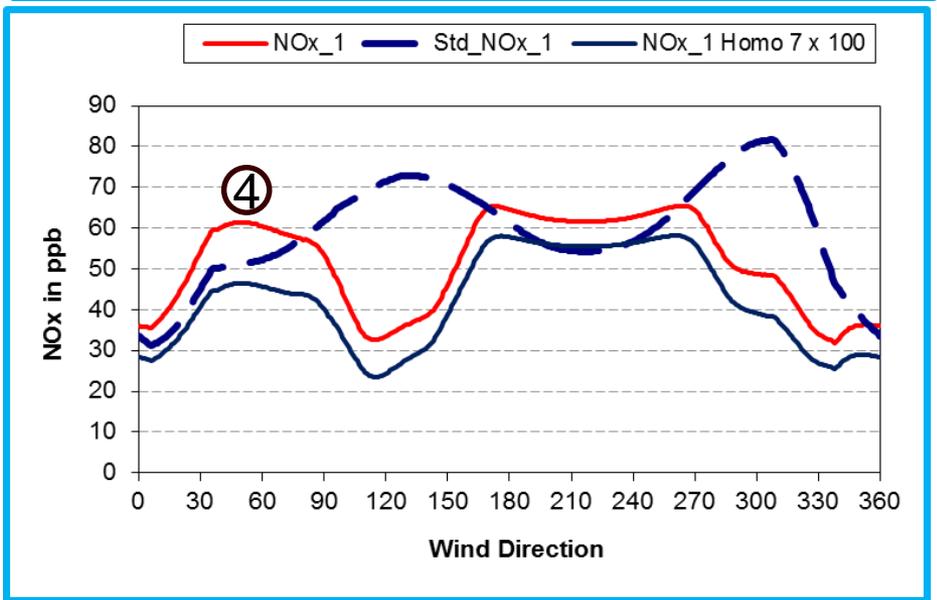

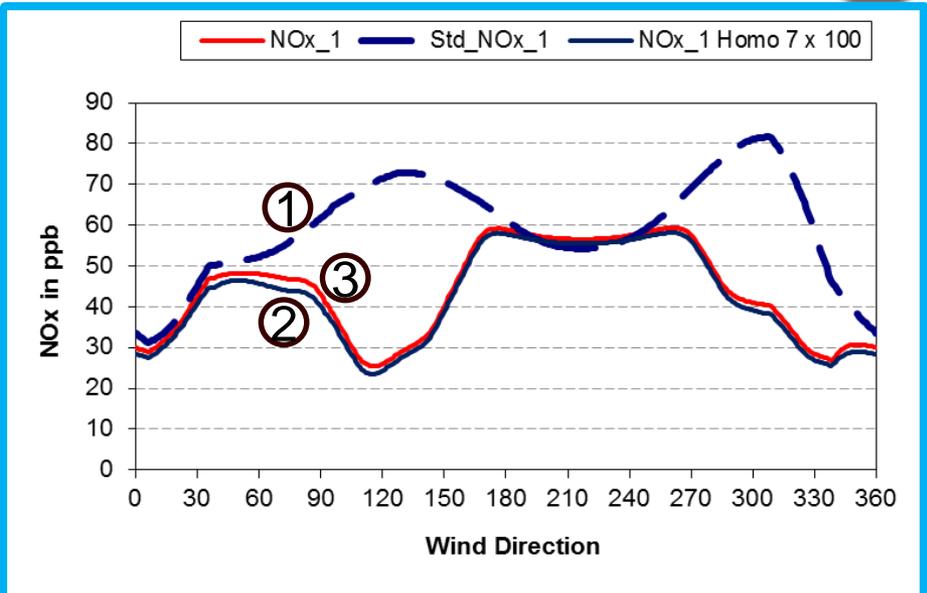

In Progress

- › Sensitivity study
- › Constant emission/
wind speed
- › Variable wind direction

- ① Standard, emissions homogeneous over all street (50m)
- ② Limit to (7*3m=21m) emissions homogeneous
- ③ As 2. + non-homog. emiss.
- ④ Moving emissions 3m closer to receptor

New OSPM

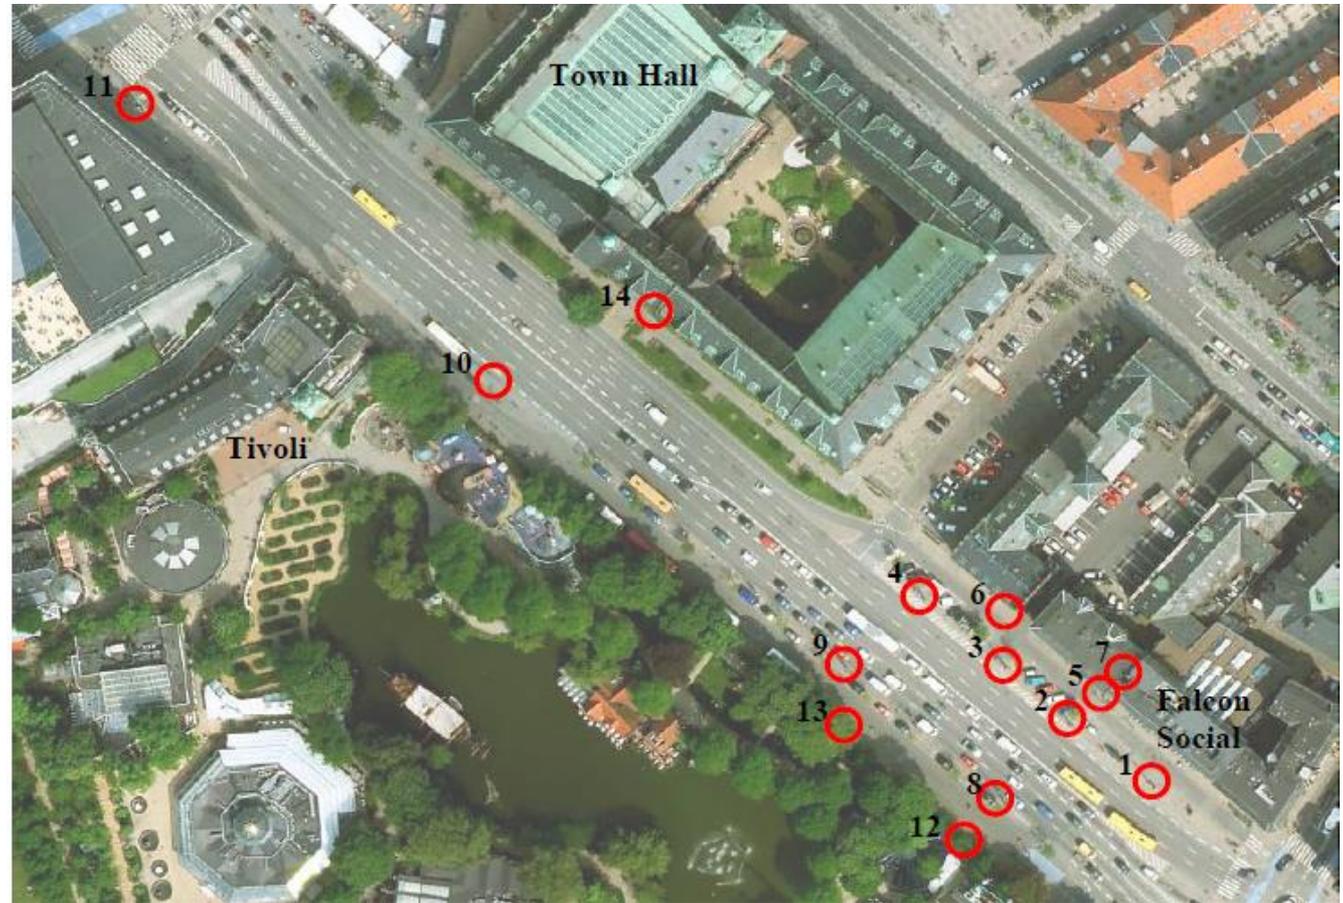

- 14 locations
 - 3 x 1 week exposure
 - Nov. / Dec. 2015
- Radiello tubes
- Very wet period
- wet tubes

- Large scatter between the 2..3 co-located tubes
- Large bias compared to permanent station

□ 14 locations

background

Methods

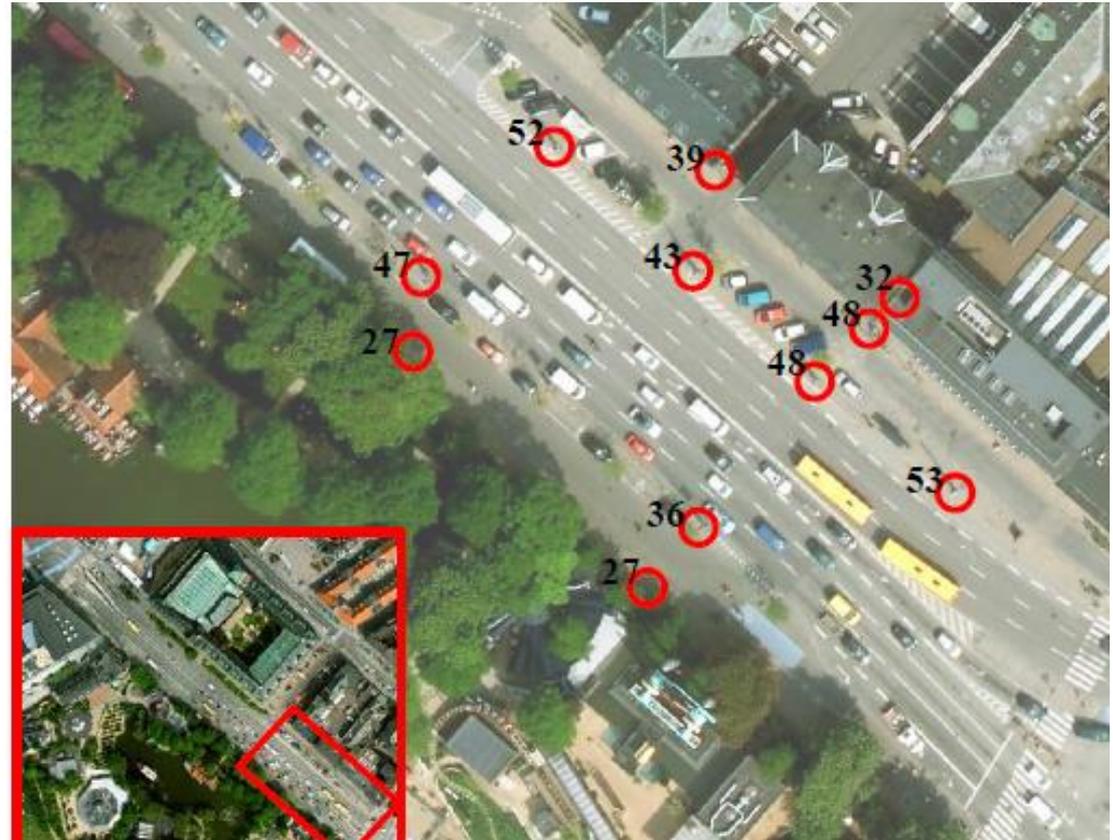

Results

In Progress

- ❑ Mean from all 3 campaigns
- ❑ Large scatter/ uncertainty interpret with care
- ❑ NO₂ conc. in $\mu\text{g}/\text{m}^3$

- ❑ Analysing old data gains new insights
 - High spatial gradient of NO₂ concentrations
 - Wind direction dependence is very important indicator
- ❑ First time traffic counts lane for lane
=> emission per lane
- ❑ "starting to understand" what is going on at HCAB
 - OSPM (non-homo) is in qualitative agreement with observation

Future:

- ❑ Passive campaign to be repeated maybe IVL or other type samplers
- ❑ More OSPM modelling, moving receptor not emissions
- ❑ CFD (MISKAM/OpenFOAM) modelling ?
