10-14 June 2024,  
Pärnu, Estonia

# Snow layers

---

- \* First snow melts
- \* Ground temp  $< 0^{\circ}\text{C}$  then its stay on ground
- \* Weather episodes

# Sampling in Estonia

---

- \* chemically analysed since 1985
- \* **Permanently:** Basic anions and cations
- \* **Occasionally:** Chemical composition of solid deposit, trace metals, black carbon, fly ash particles of specific shape

Stable snow cover is a natural collector of ingredients deposited from the air

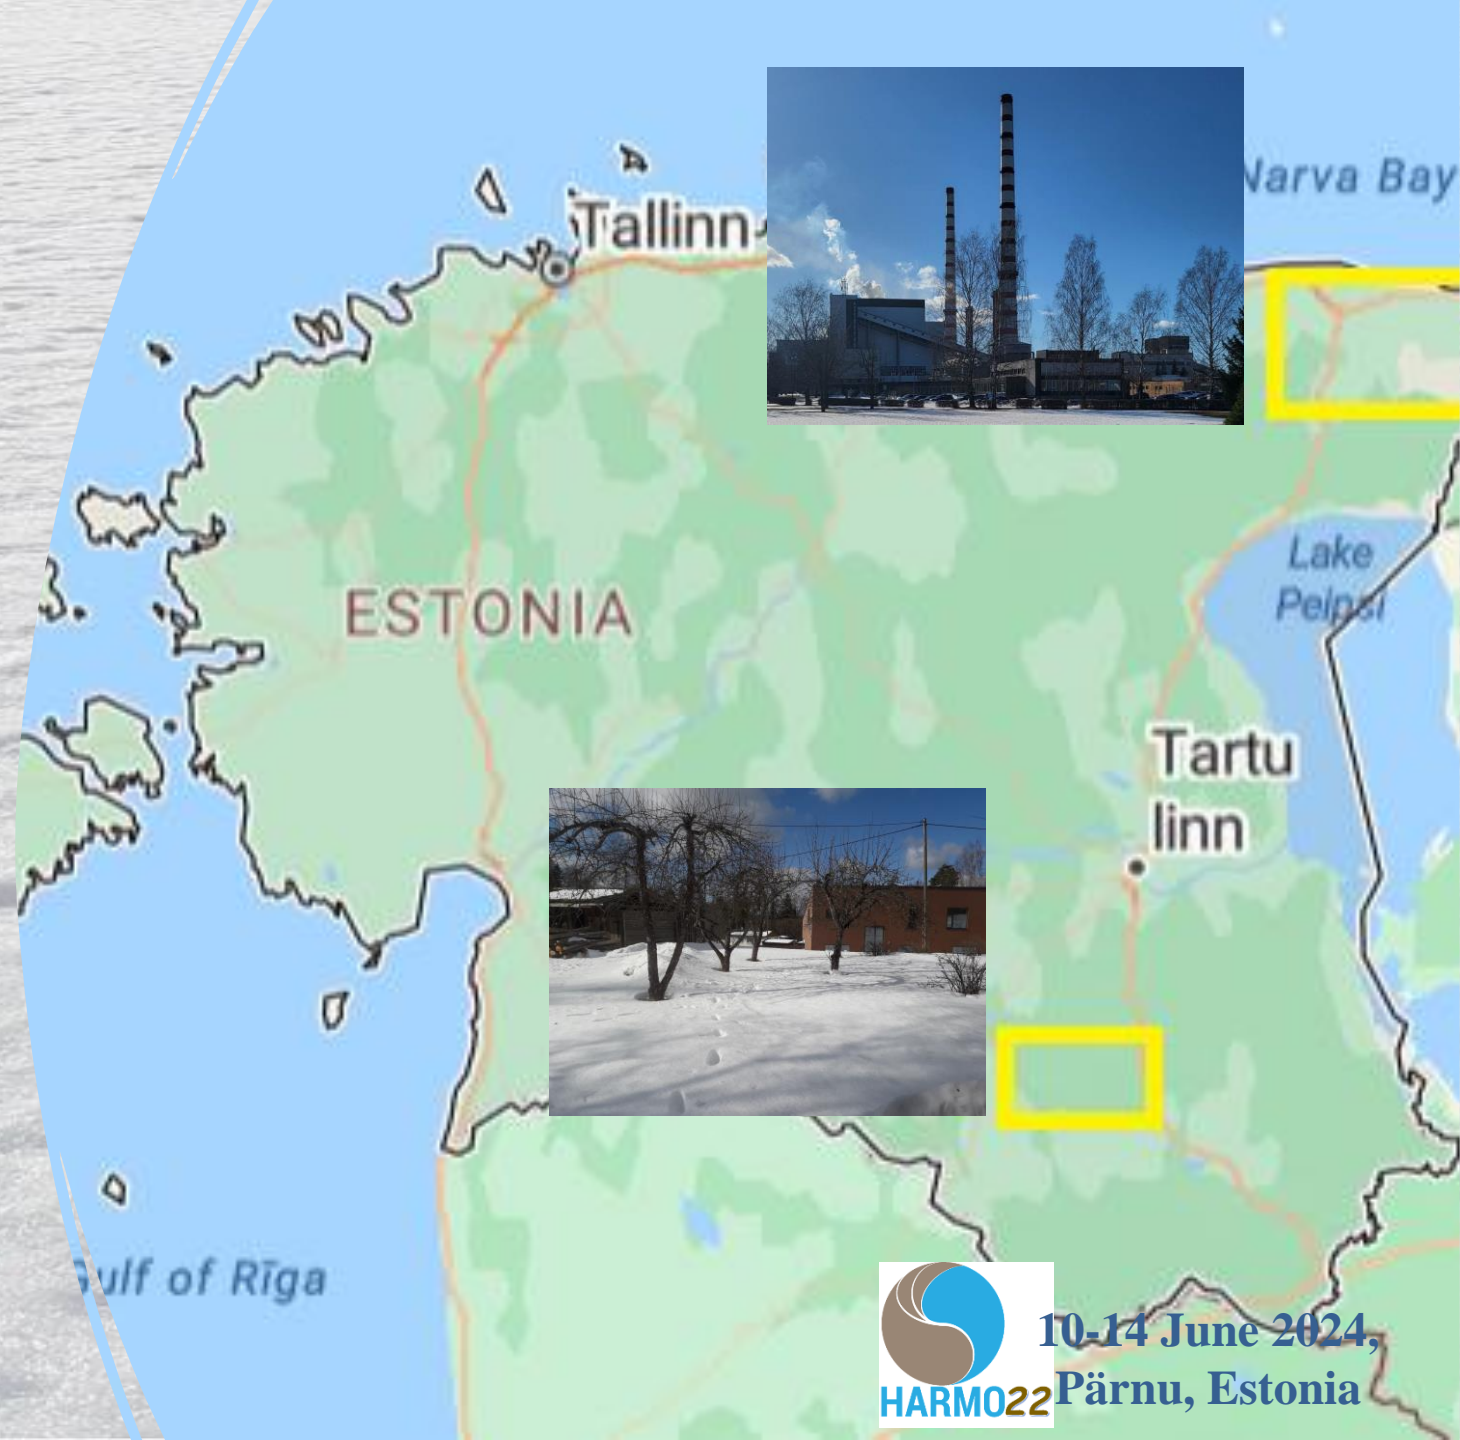

10-14 June 2024,  
Pärnu, Estonia

# Area

---

- **Northern Estonia:**  
industrial area
- **Southern Estonia:**  
small towns as and  
rural areas

# SNOW-BASED QUANTIFICATION OF DEPOSITION FLUXES

- \*Tube sampler (S)
- \*Time interval (t)

10-14 June 2024,  
Pärnu, Estonia

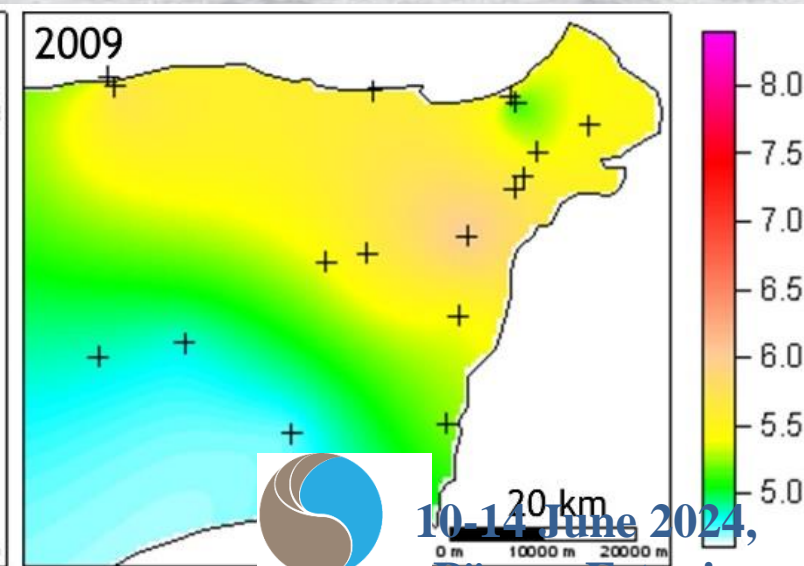

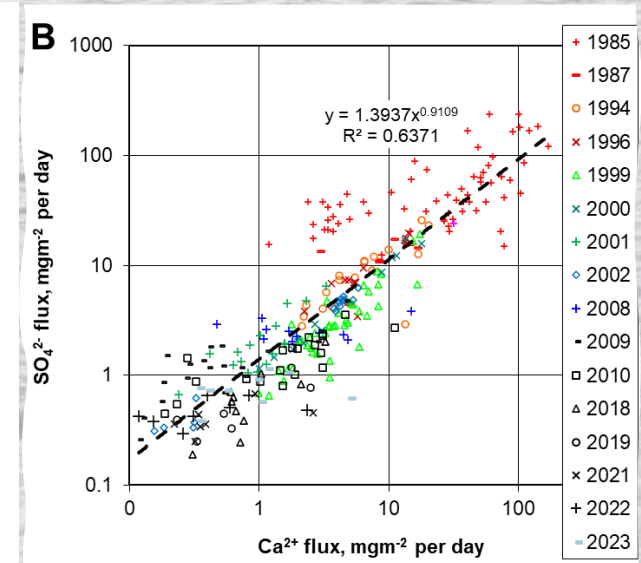

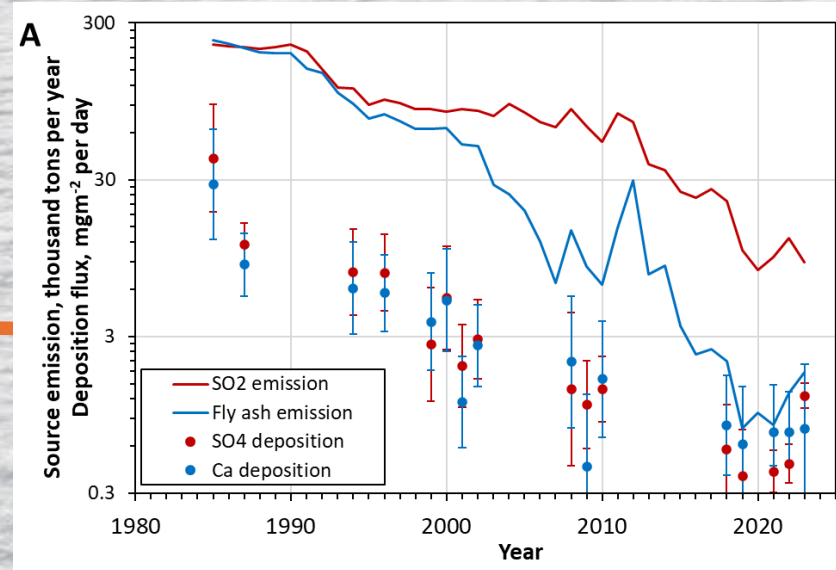

# Industrial pollution: an historical overview

Kukersite oil shale as a solid fossil fuel of unique composition

- Extremely calcium-rich fuel
- Its fly ash is strongly alkaline

Fly ash influx is alkalization of naturally acidic soils

# Model validation efforts

**AEROPOL model:** First comparison of air pollution transport and deposition model

- 1990's in Tartu Observatory: based on extensive snow sampling campaign in 1985
- Measurement: calcium and sulphate deposition

Snow- based deposition data were Input for **HILATAR model (2003)**

- Slight underestimation
- rather high linear correlation (0.67)

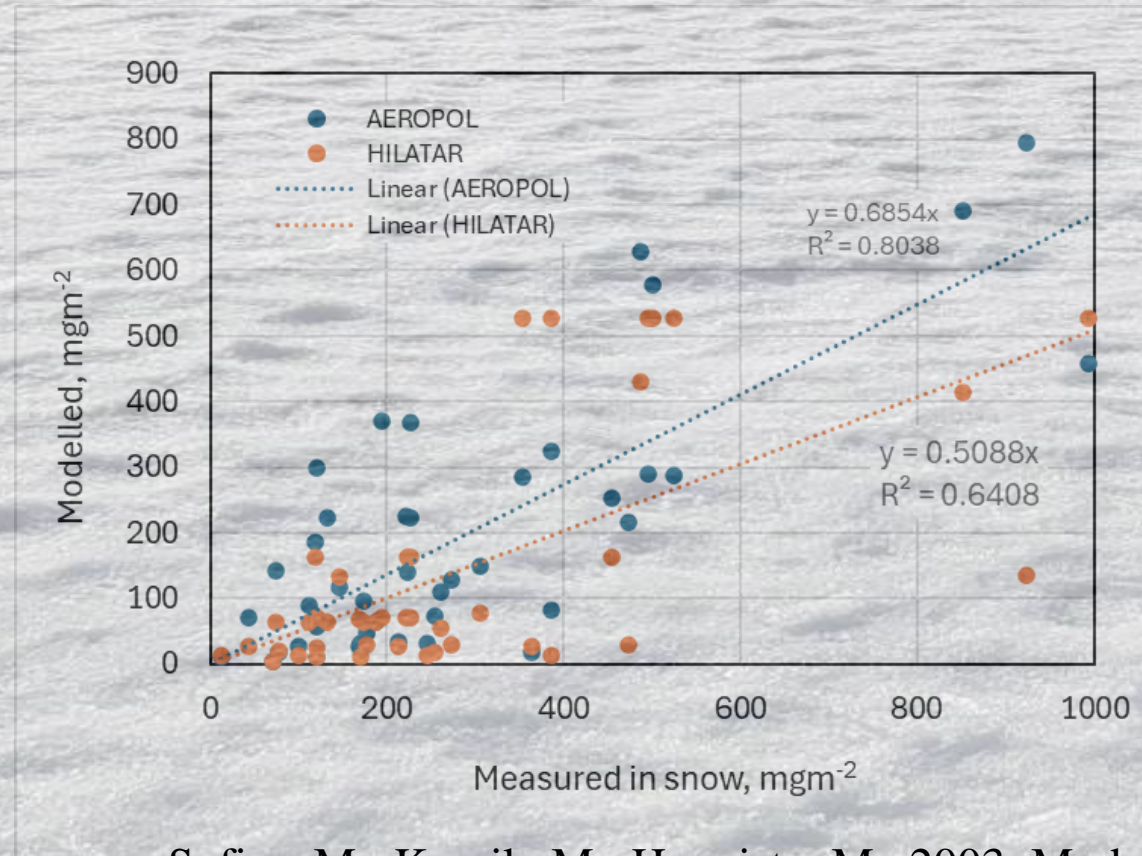

10-14 June 2024,  
Pärnu, Estonia

# Model validation efforts

- Comparison of modelled and measured calcium deposition in Estonia for the winter 1998–1999.
- Snow samples were collected during the period of stable snow cover (50–70 days for different sites since January 7, 1999).

Sofiev, M.; Kaasik, M.; Hongisto, M., 2003: Model simulations of the alkaline dust distribution from Estonian sources over the Baltic Sea basin. *Water Air & Soil Pollution*

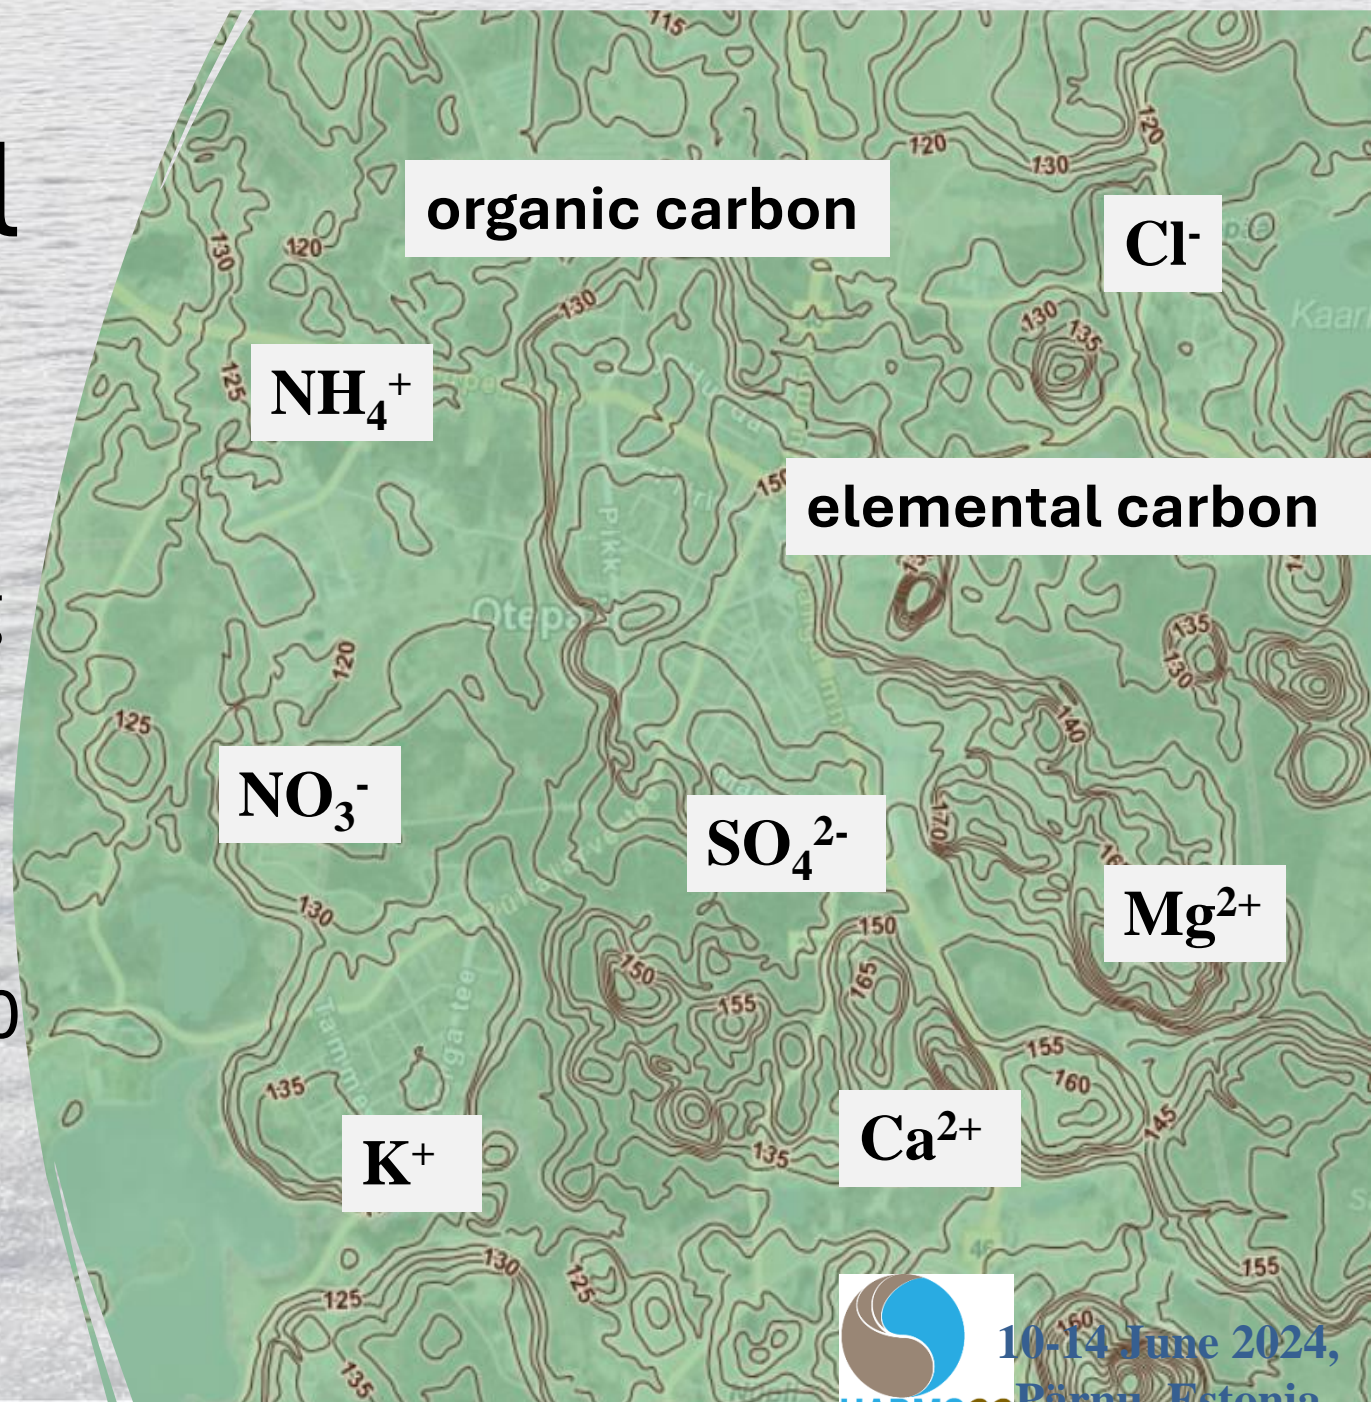

# Deposition in rural areas (OTEPEÄÄ)

Local residential firewood heating

- 2200 inhabitants
- Sampling: 2022 (79 d), 2023 (41 d) and 2024 (53 d)
- 8 sampling sites located 110-180 m above sea level

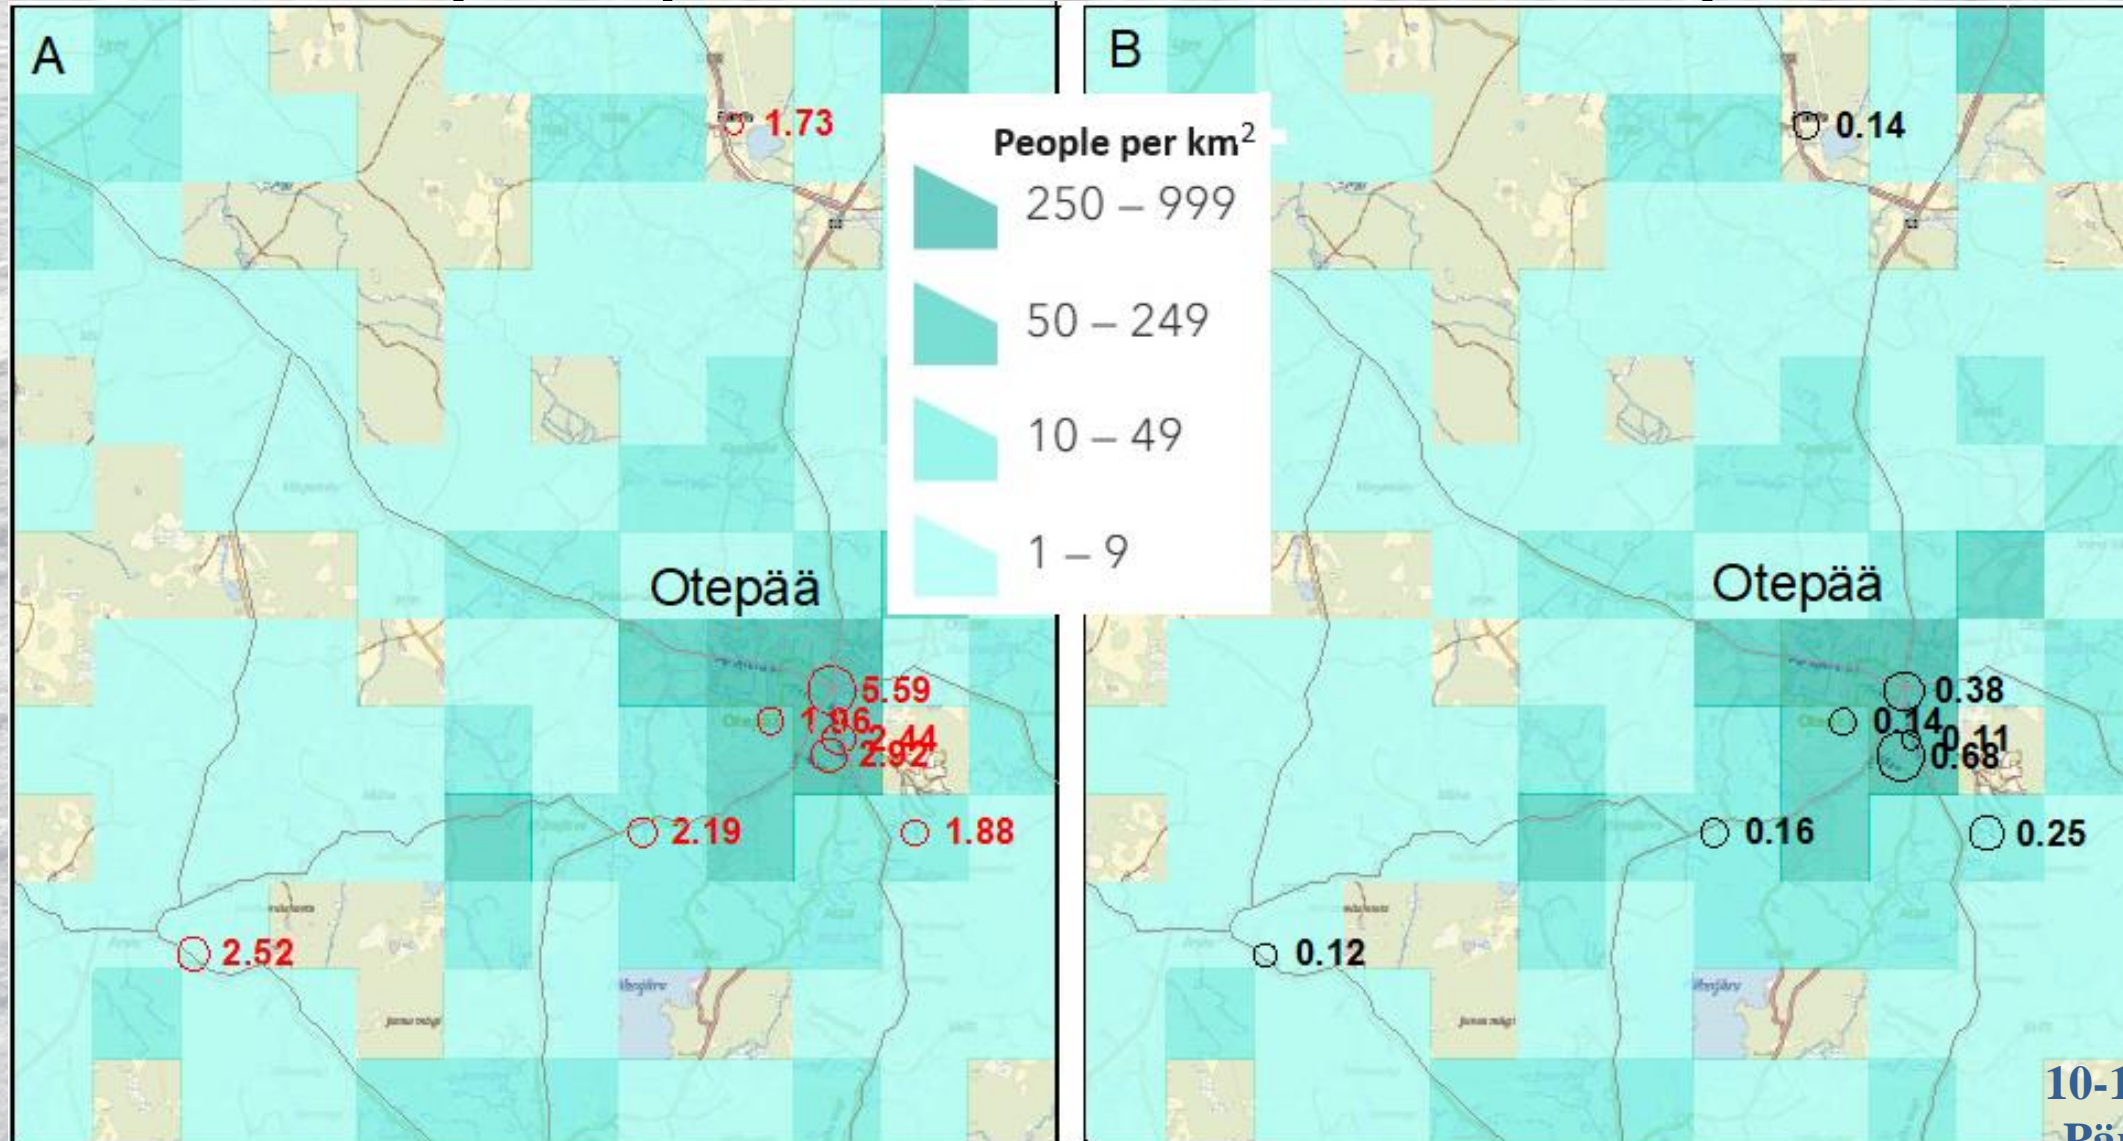

Condition: snow cover is stable enough, last > 30 days

10-14 June 2024,  
Pärnu, Estonia

# Summary: deposition fluxes of analyzed ions

# CONCLUSIONS

continuous and prominent decreasing trend in air pollution

- decrease of kukersite oil shale mining
- Decrease of smoke gas purification
- Decrease firewood-based heating in a rural area

The measurements of air pollution deposition based on snow samples works

10-14 June 2024,  
Pärnu, Estonia
